SUMMARY

Software engineer with 12 years of experience, now Team Lead at Rebilly (payments infrastructure), where my team owns identity, access and account features across the stack. I build shared UI foundations in Vue, Svelte and TypeScript, and backend systems in PHP/Symfony on MySQL, PostgreSQL and Redis: authentication, authorization, API key security and asynchronous provisioning.

SKILLS

Frontend: TypeScript, JavaScript, Vue 3, Pinia, Svelte, HTML, CSS, Tailwind, PWA, WebSockets
Backend: PHP (Symfony, Symfony Messenger, Doctrine ORM), REST APIs, OpenAPI, Go
Data and infrastructure: MySQL, PostgreSQL, Redis, ClickHouse, Elasticsearch, AWS SQS, Terraform
Identity and security: OAuth 2.0 / OIDC, Keycloak, Better Auth, ACL and roles, API key lifecycle
Tooling and operations: Nx monorepos, pnpm, Vitest, GitHub Actions, Renovate, Jenkins, Datadog, flag-gated rollouts
AI-assisted development: Claude Code (primary) and Cursor

EXPERIENCE

Team Lead @Rebilly **(Remote)**

Sep 2026 - Present

- Lead the team that owns identity and accounts across backend and frontend: organizations, sign-in, users and memberships, ACL and roles, API keys, custom fields, tags, email and dependency management.
- Migrated authentication from **Keycloak** to **Better Auth**.
- Hardened API key security: incident-response tooling with audit logging, key expiration enforced at authentication and managed in the dashboard, usage tracking, and per-key rate limits rolled out behind a flag.
- Designed and shipped organization IP allowlists end to end (API, SDK, dashboard, docs), with a guard against admins locking themselves out and no breakage for existing integrations.
- Closed ACL gaps and made permission checks scale to users with thousands of memberships.

Senior Software Engineer @Rebilly **(Remote)**

2022 - Sep 2026

- Built idempotent asynchronous provisioning between two services over **AWS SQS**.
- Built **Keycloak** support in the core backend and dashboard: registration settings synced to realms through the admin API, and narrowly scoped service-to-service **OIDC** auth provisioned with **Terraform**.
- Drove frontend modernization: migrated the shared **Vue** component library (about 26k lines) and FramePay to **TypeScript**, replaced heavy dependencies, and moved test suites to **Vitest**.
- Built a shared permissions editor component in **Vue** with grouped permissions, search and role templates, its catalog generated from the **OpenAPI** spec.
- Built white-label hosted login pages with **Keycloakify** and **Svelte 5**, themed per merchant with no code changes.
- Built a **TypeScript** SDK generator from the OpenAPI spec, and dashboard features including an automated blocklist and risk score simulation reports.
- Conducted technical interviews as part of hiring, and mentored new engineers through onboarding until they shipped independently.

Front End Engineer @Flightradar24 **(Remote)**

2021 - 2022

- Helped design and rewrite the whole Flightradar24 website frontend in **Vue.js**, **TypeScript** and **Tailwind** while new features kept shipping, without breaking existing functionality.
- Shipped new product features and coordinated their releases with the Android and iOS teams so they launched on all platforms at the same time.

Front End Team Lead @FortuneJack

2019 - 2021

- Designed the architecture of the new fortunejack.com and led its frontend development.
- Built a server-driven template system that let the team change page UI without a developer.
- Added real-time updates for user events over **WebSockets**.
- Introduced **Git-flow** for releases and cleaned up the legacy CSS and JavaScript on the old site.
- Wrote internal APIs in **Go** and **PHP** and standardized existing endpoints as REST.

Front End Team Lead @Livo

2019 (6 months)

- Led five frontend developers building a real estate platform for a subsidiary of Georgia's largest bank, plus internal tools for its support and call center teams.

Front End Engineer @FortuneJack

2018 - 2019 (7 months)

- Finished the mobile version of fortunejack.com and turned the site into a **PWA**.

Front End Developer @Betsson Group **(Europebet)**

2018 - 2019 (7 months)

- Built a reusable lobby component library shared by all of Europebet's PvP games (Backgammon, Bura, Keno).
- Built the rendering library used to draw those games in the browser.

Full Stack Developer @Proservice

2015 - 2017

- Built web applications for clients and moved the company's in-house CMS to **Vue.js**.

Full Stack Developer @Absolute 2014 - 2015

- Built a complete food delivery platform, similar to Wolt or Glovo, covering both backend and frontend.

VENTURES

Co-founder @Flux Gaming 2025 - Present

- Co-founded a small game provider with three games live on Stake.com and 60k+ unique players.
- Lead frontend development of the games, including one upcoming release.

Co-founder @Zenyou 2023

- Co-founded an AI mindfulness assistant that generates a meditation tailored to each user for every session, and built the whole system as its only engineer.

PART-TIME AND FREELANCE

Front End Consultant (Part-time) @Connect 2019 - 2021

- Trained the team of 8 developers in **Vue.js** and the modern frontend stack.
- Helped the team improve page performance and Core Web Vitals across their websites.
- Helped implement server-side rendering with **Nuxt.js** on projects that required it.

Trainer @Mziuri 2019 - 2021

- Mentored several cohorts through a web development bootcamp.

Freelance

- Built and launched 15+ projects for clients including some of Georgia's largest companies, such as Georgia Healthcare Group and subsidiaries of the country's largest banks.

COMMUNITY

Co-organizer @BeerJS Tbilisi 2024 - 2025

- Organized meetups for JavaScript developers and helped bring together the local developer community.
